Portal-based delivery

Delivery model

WHAT IS ALREADY CONFIRMED

- The product is built around the company portal and control contours rather than around a single feature or screen.
- AI is already embedded in selected workflows with approvals, tools and audit discipline.
- The delivery model, control plane and operating logic are already assembled into a pilot-grade operating environment without overclaiming the full breadth of the platform.

STAGE TODAY

- The current guided walkthrough already reveals the portal, AI, workflows and management visibility in one controlled flow.
- Selected scenarios can already be discussed as an early pilot without presenting the whole platform breadth as finished.
- The next stage is making launch, rollout and selected working intersections more predictable and repeatable.

TEAM AND ROUND

- Category thesis, product scope, demo sequence and the first launch model still sit in one place instead of being fragmented across an early team.
- Logicot already shows a working demo core, an architecture trust layer and a proof package that can be discussed on facts.
- The focus is a repeatable pilot path, early deployment motion and roughly 16-17 months to the next fundable milestone. Logicot is early not because the product thesis is missing, but because one ownership model has already assembled the category, the working core and the first rollout path and is now turning that into a repeatable launch model.
